

Theater Sound Designer.

Design theaters and media rooms with the right speakers, every time.

MSE Audio Theater Sound Designer takes the guesswork out of choosing the correct speakers to achieve **performance level audio** in a room.

Theater Sound Designer

Theater Sound Designer features dARTS digital speakers and PhaseTech CI and PC products and will soon expand to include Induction Dynamics theater options.

To use the Theater Sound Designer, users select parameters about the theater space, the type and number of speakers and the performance level. When done, the theater designer will present the optimal theater loudspeaker/subwoofer combination to meet the project's requirements. Fast, Easy, Accurate.

dARTS Active and **PhaseTech CI** and **PC** products all share a common goal — deliver great sound at performance levels. They also share a lot of common technologies all in support of a dynamic, immersive listener experience. Patented technologies with real world applications deliver discernibly outstanding audio.

Where both series have a lot of commonalities, **dARTS** takes sound to the next level with higher resolution and dual calibration. **dARTS** has the ability to reproduce what the director intended from the time they are manufactured to when they are installed in your home — features that can only be achieved in the digital domain.

dARTS active speakers utilize DSP based crossovers, equalization and time correction prior to amplification. All the woofers and tweeters are directly coupled to an amp channel, leaving nothing in the audio path to degrade the signal. This method feeds the speaker the purest signal from the source.
